Before getting into Photoshop's many features, it's important to learn how to edit photos using Photoshop's basic tools. The General Features of Photoshop Adobe Photoshop is an image manipulation tool. It has all the features you would expect from a tool of its type. Its features include adjustment layers, adjustment brushes, image restoration, web galleries and printing. The following are some of Photoshop's most important features. Unwanted Edits Adobe Photoshop is a bit of a mixed blessing in the editing of images, as it is great for helping you to make things look nice, but can result in some really odd looking photographs. The reason for this is that Photoshop is designed to be very creative, and can often end up with unwanted edits. If you have an image that you want to edit, Photoshop can be a great tool for smoothing out wrinkles and clipping on unwanted items. For example, if you have a portrait of a child who had a big nose, you may want to turn the nose down. However, if you have an image of a precious young child, you don't want to make the nose smaller, just to make a photograph appear better. So, with Photoshop, you can easily make some odd and undesirable changes. Basic Edits Adobe Photoshop is a simple tool for editing photographs. Using basic functions such as the lasso, brush and airbrush, you can easily make basic edits such as removing unwanted objects, cropping objects and making adjustments such as exposure and contrast. You can make these kinds of edits if you aren't working on a professional level, and you should know that if you make edits that aren't too subtle, you may alter the object, such as the eyes of a portrait. Removing Unwanted Elements One of the most powerful features of Adobe Photoshop is its adjustment layers. With adjustment layers, you can remove unwanted elements, such as hair or a hat, and add them back later. Adjustment layers are also very useful for changing and improving color. For example, in a portrait or wedding image, you may want to remove color from one part of the image in order to better show the subject, but you may want to add color or tone back to another part of the image to hide unwanted subjects or objects. In addition, if you don't like the way a particular color looks or if you don't like the composition of a photograph, you can

In the employ of computer networks, it has become common practice to employ computer telephone switching equipment having in the receive path a "Reverse Telco" function to store, modify, and forward e-mail messages at the dial-up protocol. FIG. 1 shows in greater detail than prior art e-mail gateways 10, for example, of the type manufactured by AT&T Corporation, the Telco Reverse network. Gateway 10 includes a step down converter 30, local access network interface 140, local area network 120, and a central processing unit (CPU) 50. Each of the units constituting gateway 10 is typically connected to local access network interface 140, through a modular optical network link such as, for example, an Asynchronous Transfer Mode (ATM) link. Gateway 10 includes a reverse telco unit 50. Referring to FIG. 2, an "input" e-mail message is received from a sender. There are many e-mail software programs available, such as Eudora.TM., and others, that are available to end users. These programs include e-mail client programs such as, for example, MacMail.TM. for the Apple Macintosh.TM. operating system. An e-mail message is received from the sender, after which it is passed through the Telco Reverse network 10 for delivery to the intended recipient. In the Telco Reverse network 10 of FIG. 1, the email message is first stored in the receive buffer of reverse telco unit 50, then, after a time-out period, the message is forwarded, in the forward direction, to central processing unit 50 for further processing. Central processing unit 50 includes software which performs logical, data manipulation, and manipulations of the message, and e-mail is modified accordingly by the central processing unit 50. After modification by the central processing unit 50, the message is stored in the send buffer of central processing unit 50 and is then sent out the network link as an e-mail. In FIG. 1, reverse telco unit 50 includes an e-mail store buffer having a first interface for receiving the e-mail message, a second interface for transferring the e-mail message to central processing unit 50, and a third interface for communicating with local area network 120. In the e-mail store buffer, the e-mail message can also be temporarily stored. The computer telephone switching equipment of the prior art has several shortcomings. Since the prior art equipment has a finite amount of memory to which messages can be

Q: On metatags - is it ok to use meta keywords and meta description or is this spam? I'm building a company blog. Is it ok to use a meta keywords/meta description field in the to let Google know what kind of content I have? I.e. the title should be Product blogs - category or something like that. What about the meta description? Should it match the title? What if I have 10 posts and I use the same title for every post? Should I change the title for each individual post to something more unique? A: You should use a proper description, or user description in Google. But then, I would use your product name, and not your company name, with a description something like: "We work on stuff for restaurant X". It's up to you. Do whatever makes your content SEO-friendly, of course. Q: Finding the number of cubes that were needed to make to make a particular shape I have a shape, which, by some obscure logic, has an area of 15 and a perimeter of 60. Is there any simple way to determine that all I need to do is add and subtract sets of 2, 3, 4, 5, 6, and 7 cubes so that I can get the desired shape? (i.e., 2, 6, 6, 3, 3, 3)? Or if there is no way to do this, is there any way to say "let's add a cube at this corner and a cube at that corner and a cube there", and keep going until I reach the desired shape? A: The tricky part is finding the "obscure logic". It's essentially a right-angled isosceles trapezoid, with the angle at the bottom being the same as the angle at the top. Pythagoras tells us that the square of the hypotenuse is equal to the sum of the squares of the other sides, so the base times the height is equivalent to the sum of the base times the height (that is, the total area). Since the area of the larger triangle in the picture is identical to the area of the smaller triangle, the volume is the same, so the total volume is equivalent to the sum of the volumes of the smaller triangles. The volume of a right-angled isosceles trapezoid is equal to 1/
