Graphic editing in AutoCAD is a powerful feature. It has the ability to access and modify the drawing layer as well as being able to provide users with a number of tools for creating graphics and updating the drawing. This section covers graphic editing in AutoCAD. Graphics applications in AutoCAD include Vector Design, DraftSight and Autocad Publisher. Vector Design creates vector graphics, typically from AutoCAD drawing information, and then can be used to print and publish the vector graphics. DraftSight is used to create technical drawings. It also has a full-featured drafting application. Autocad Publisher is used to publish and print AutoCAD drawings to other software programs. In AutoCAD, the Drawing layer may be viewed as a container for individual graphical elements. The Drawing layer is the workhorse of AutoCAD. It is the layer on which every editable feature is placed. The Drawing layer may also be referred to as the Layer 0 layer. It can be divided into other sublayers, such as the Text, Drawing Objects, Hidden and Design layers. General commands Edit selected layer Opens the drawing's Property Manager with the selection active, or opens the Drawing Properties dialog box. The selection will be canceled if the drawing is open in a different drawing or if the layer is not open. Close selected layer Closes the drawing's Property Manager. If the selected layer is closed, the layer properties dialog box, used for editing the layer's properties, is closed. Go To Opens the selected layer in the active drawing. Export Saves the selected layer to a file that can be shared with other users. Close Closes the selected layer and then closes the active drawing. Zoom Increases the magnification level for the selected layer. Zoom out Decreases the magnification level for the selected layer. Extents The Extents command gives a visual display of the full extents of the drawing, including layers, linetypes, dimension styles, annotation styles and text styles. You can zoom to any extents or change the extents that the command uses. Enter Layer Extents Sets the layer extents to the current extents of the selected layer. Enter Layer Extents - All Sets the layer extents to the current extents of all layers. Enter Layer
