Zte z667t Unlock nck box.5\times10^{ -6}\$ is the fraction of AGN that are detected by WISE. For each galaxy in our sample, we calculate \$L_{\rm X}\$, assuming the average properties of AGN (see § \[subsec_lx\]). Then we assume an average IR-X-ray correlation \$\log L_{\rm IR}=0.77\times\log L_{\rm X}\$ [@rani11], and obtain total IR luminosities (restframe 8-1000\$\mu\$m) for these galaxies. The WISE bands have an effective wavelength from 3.4\$\mu\$m to 22\$\mu\$m, and the average restframe 8-1000\$\mu\$m luminosity of AGN [@rani11] is \$\sim\$5-10\$\times10^{11}\$L\$_\odot\$. We find a total IR luminosity in our sources of \$\sim\$2-3\$\times10^{12}\$L\$_\odot\$. This result implies that our WISE-selected AGN are representative of the majority of the AGN population at this luminosity level. To ensure completeness of the sample, we only include galaxies with \$z\leg0.15\$ (restframe 912\$\varphi\$
