A: The file you are downloading contains a text file. Every line in the text file begins with . The following is a visual representation of the binary data contained in your zip archive: If you wish to unzip such a file into an ordinary directory structure, you'll need a program that can deal with text files. The text file you have downloaded is in the ISOLATE format. I don't have a link to a program that can deal with this format, but you can probably search the web for a program called a "unzip" program. The role of anxiety in the development of somatic

symptoms. Somatic symptoms are experienced by 25% to 30% of the general adult population. Onset is typically insidious, with the first symptoms often appearing in late adolescence or early adulthood. In contrast to the studied psychosomatic disorders, prevalence rates of medically unexplained symptoms (MUS) peak in middle adulthood. The annual prevalence of MUS is 24.4%, with pain and fatigue the most common symptoms. We examined the role of anxiety in the development of MUS. Data were analyzed from 330 university students, of whom 23.6% met DSM-IV-TR criteria for a current affective disorder. Participants completed self-report questionnaires to assess somatization, anxiety, depression, and pain. Differential analysis found that anxiety was associated with more somatic symptoms and somatization was associated with more pain. These results suggest that anxiety may play a role in the development of MUS in a subclinical sample.Q: i need to sync state between the web server and the

client i have a web server and a client. In the client i need to know the location, name and authenication of some files. What is the best way to do this? i'v heard about broadcasting. How to do this? Can you provide me some links? A: Web Sockets would probably be the way to go. They allow you to send any sort of arbitrary data between your web server and your client. What you need to do is add a Web Socket handler to your web server. You can use the built-in one: @WebSocket public class HelloWorldServlet extends HttpServlet { //... @Override public void service(HttpServletRequest request,

Hellanzb 3.3 RPMÂ .Q: Plotting a known progress curve I am not sure how to ask this question, so the answer may be obvious. I have seen a number of questions on here and the internet, but the answers all seem to use a least squares regression model and I can't get my head around that. I would like to just know how to create a simple gnuplot curve that shows a trend of how long it takes to complete a process. I have a very simple process that takes a 3D volume, normalises it then creates a series of cross sections. I have the size of the volume, the duration of the process, and I know I start at the beginning of the volume and it takes 1 second to complete. I know the dimensions of the volume and I know how many cross sections I need. The volume can be defined by: r, theta, z where r is the radius of the volume, theta is the angular coordinate in the xy plane and z is the z coordinate. I need to plot a line that shows the progress as a percentage. I don't need to know the actual

time, only that it takes 1 second to go through the process. If possible, it would be great if I had a simple equation for the curve, but I can work it out in gnuplot if that is harder. Thanks for any help! A: Well, since it seems some people want to answer it anyway, I'll give it a shot... For a completely arbitrary radial point (r, theta, z) the equation of your interpolated curve is $y(t) = (1 - t)^{**}t * t^{**}(t - 1) * (1 - t)^{**}(1 - t) * (1 - 2*t)^{**}(1 - t) * (1 - 2*t)^{**}t$ $y(1) = 1 - 1.5 * x + (1.5 - 1.75)*x^2 + (1.75 - 2.25)*x^3 + (2.25 - 3.5)*x^4$ or if I don't assume theta = 0 and z = 0: $y(t) = (1 - t)^{**}t * t^{**}(t - 1) * (1 - t)^{**}(1 - t) * (1 - 2*t)^{**}$
