May 18, 2015 - I never understood why flash based games like Peach's Tale, Mario are missing and have such terrible frame rates on my other computer. But when I got the Wii U at the end of 2013, they decided to include Mario Kart 8, where the speed is much faster than I've ever seen before. I was really surprised. A few months after release, I realized that all those high-speed Wii U games are not all games. They included many of the games that have been on the market since 2009 on PC. Once I figured this out, I started using search to see if there were any Wii U games that were over my speed.

In recent years new endoscopic instruments have been developed that allow the surgeon to view the surgically crucial structures using fiber optics. It is necessary for the surgeon to know the optimal shape of the instrument end so that the most critical features of the endoscope will intersect with the distal aspects of the patient's body and keep the end of the endoscope well clear of surrounding tissue. Two endoscopes have been tested: a custom-built instrument and a conventional video endoscope. Both instruments are made of rigid plastic. The objectives of this research were to assess the precision of the design process used to build the endoscope and to demonstrate that the built instrument allowed the surgeon to visualize structures within the body that could not be seen with the conventional endoscope. Using an in vitro system, six human livers were perfused with formalin. Within each perfused liver four live animals (sham-operated in the same period) were prepared with a transparent plastic port. The internal structures of each animal were

optically visualized using both endoscopes. For comparison c6a93da74d
