the final part is a high pass filter with a pass band of 3 hz to remove some of the noise and low frequency oscillations in the system. we're now ready to move on to building the controller. please note that, as an alternative, we can also connect the output linear velocity port of the pure pursuit block to move the vehicle with a constant block to define the velocity. however, since in later models we'll be adding some more dynamics and a longitudinal controller, we will stick with a constant block to define the

velocity. to learn more about implementing pure pursuit controller for a differential drive report, just check the links in the description. due to the fact that the servos are limited in their positioning accuracy, and while small errors in input angle will have a dramatic effect on the vehicle and controller response, such a small error may not be detectable to the driver and other passengers. this is where we can benefit from the multiple degrees of freedom that pure pursuit provides us with. for this reason, it is recommended that the pure pursuit block be connected directly to the vehicle input port. however,

if you wish to use pure pursuit for later models, where you have to add some more dynamics and a longitudinal controller, we will connect the pure pursuit output to a constant block to define the velocity. this will allow us to seamlessly add the dynamics and controller into the next part of the project. please note that, as an alternative, we can also connect the output linear velocity port of the pure pursuit block to move the vehicle with a constant block to define the velocity. however, since in later models we'll be adding some more dynamics and a longitudinal controller, we will stick with a constant block to define the
