a number which represents the number of floating point multiplications or additions per second, abbreviated as flops. it is a figure of merit in microprocessors used to gauge the power of the processor. flops are usually measured in gigaflops (gflop) or teraflops (tflop). yield or yield rate: the yield is the proportion of microprocessors that work properly out of all the microprocessors that are manufactured. it is expressed as a decimal fraction. since a microprocessor is made by many small parts, yield of microprocessors is not 100%. clock frequency: the clock frequency of the microprocessor is the number of times the microprocessor's clock ticks per second. clock frequency usually measures frequency of an internal oscillator with a fixed reference, with scaling of the division by the number of bits in the microprocessor's address bus and register set. clock frequency of most 32-bit microprocessors is between a few hundred mhz and a few ghz. the part number gives the name of the microprocessor along with its properties. every microprocessor has a unique part number. the part number of the microprocessor is generally the same as the microprocessor's name. for example, intel 8080 processor is known as intel 8080 and is also known as model 8080a and the ibm 7090 processor is known as ibm 7080 and is also known as model 7080a and so on. the manufacturer of the microprocessor is the manufacturer that designed and manufactured the chip in a very tiny volume. generally, a chip manufacturer is a semiconductor company. a chip manufacturer is also known as the silicon foundry. nomenclature:
