Q: Ubuntu 13.10 - Is ther EFI bootloader? I'm trying to install Ubuntu on a system with legacy BIOS. I took a look at the official Ubuntu documentation where it is indicated that If your computer is a x86 PC with a BIOS or UEFI firmware, your Ubuntu installation medium should be in the BIOS/EFI partition on the disk. I'm a bit confused with this because I installed Ubuntu on my system and I didn't have to make any changes to EFI partition so I don't know whether EFI bootloader is on the disk or is missing? A: If you installed Ubuntu from scratch, it didn't use EFI. In order for Ubuntu to work with legacy BIOS you need to set your partition table to be GPT and then you should have EFI partition as unallocated space and you need to prepare it like this: Press Ctrl+Alt+T to open Terminal Type `sudo fdisk -l /dev/sda` and hit Enter You will see the device as `/dev/sda` Type `sudo parted -l` to see the available partition on `/dev/sda` Type `sudo mkfs.fat -F32 /dev/sda2` to format your EFI partition. Exit terminal and reboot. Now you should see Ubuntu menu on your BIOS. If you don't see it then go to BIOS menu and check your settings. If there is something configured like that, you should be able to hit ESC on boot to get to boot menu and chose Ubuntu there.
