Apple is no stranger to desktop publishing software. The Camera RAW plugin for Photoshop was introduced in version 6 along with the DNG format, not to mention the Magic Wand tool in Photoshop, which is also an Apple creation. However, the 2 best reasons for owning a D700 remain: exposure metering and RAW image processing. Sigh. So, how does Lightroom perform? Let's find out! The first thing I did was download the program and give it a try.Apple has done a great job cleaning up the interface for new users. We are lucky that the latest version of Lightroom is far cleaner than what we saw six months ago. The updated organization is more intuitive, and many of the changed view organization is due to exponential increase in resolution. For instance, with DNG images, the raw editing that used to be in the Develop module is now a whole new module. Shutterbugs rejoice! The move of editing raw to a new module means you can easily find your images while editing. An outdated area of the Photoshop interface has been fixed in Lightroom 5. The majority of the changes were related to organization. The following tutorial is provided to utilize some of the new features to the fullest. However, the most exciting update in the update is the raw file support. With this support, camera users can work in a completely untouched environment from their original raw images. For example, you can retouch the exposure, modify the white balance, auto-adjust the white balance and sharpen the image without losing any quality. On the other hand, you also can make simple corrections without closing the image. Overall, I was very happy to see the development of this area of editing, since it's been a long time. To make the program even better, Adobe has released a new module which will provide more functions for even more customizing of raw images. So make sure you check this out before you buy... it might be worthwhile.
