people using it to create images continues to grow. With a dedicated team of experts focused on porting Photoshop to the new native APIs, we're going to deepen the relationship between Photoshop. Even before the transition to the new native shader APIs, some of our work was already underway -- a good example is the work on short-circuit rendering to create the best possible PS preview: Finally, we're working specifically on the 3D features and technologies, together with the core product teams, to ensure that Photoshop can truly leverage the full power of these more modern, more stable, APIs, like we've already seen with the recent release of the native GPU APIs. We also announced that we will enable native GPUs in Photoshop this year and now that time has come. To support this, we've rebuilt the 3D engine layer by layer to integrate the new features and use the native toolsets to achieve the best results possible. We also made some other improvements to help the native feature support with examples and best practices. The most Requested feature is morphing—folding, blending and unfolding. We've redesigned the interface and features to make it easy to carry out these common tasks. In the future, there is also more to offer, like the ability to morph parts of the same layer. This will let you work with ultra fine details without the need for rasterization—especially for the creation of complex illustrations where photo-journalistic-style techniques are used.
